

SPECIFICATION

Character Type Dot Matrix LCD Module

JM404A

● GENERAL SPECIFICATION

Interface with 4-bit or 8-bit MPU(directly connected to M6800 serial MPU)

Display Specification

Display Character: 40character X 4line Character Font: 5 X 7dots+cursor

Display type: STN ,TN

Display color-Display background color: ① STN: Black-Yellow Green,Blue-Gray
Black-White

②TN: Position,Negative

Polarizer mode: Positive,Negative;Reflective ,Transflective, Transmissive

Viewing angle: 6:00 OR 12:00

Display duty: 1/16 Driving bias: 1/5

Character Generator ROM (CGROM):8320 bits(192 characterX5X7 dots)&(32 character
X5X10 dots)

Character Generator RAM (CGRAM): 64 X 8 bits (8 charactersX5X8 dots)

Display Data RAM (DDRAM): 80X8 bits (80 characters max)

Mechanical characteristics (Unit:mm)

Extenal dimension: 196.0X56.0X10.0 (14.5 for LED Backlight)

View area: 167.0X33.0 Character font: 5X7dots+cursor

Character size: 3.45X5.98 Dots size:0.61X0.66

Character pitch: 4.04X7.00

POWER: +5V power

● **Optical Characteristics**

(1) Definition of viewing Angle

(2) Definition of Contrast Ratio:

$$\text{Contrast Ratio} = \frac{\text{Reflectance value of non-selected state brightness}}{\text{Reflectance value of selected state brightness}}$$

Test condition : standard A light source

(3) Response Time

Response time is measured as the shortest period of time possible between the change in state of an LCD segment as demonstrated below

● External Dimension

● Absolute Maximum Ratings

Item	Symbol	Condition	Standard Value		Unit
			Min	Max	
Supply Voltage for logic	Vdd	Ta=25°C	-0.3	7.0	V

Display position	2-11	2-12	2-13	2-14	2-15	2-16	2-17	2-18	2-19	2-20
DDRAM address	4A	4B	4C	4D	4E	4F	50	51	52	53
Display position	2-21	2-22	2-23	2-24	2-25	2-26	2-27	2-28	2-29	2-30
DDRAM address	54	55	56	57	58	59	5A	5B	5C	5D
Display position	2-31	2-32	2-33	2-34	2-35	2-36	2-37	2-38	2-39	2-40
DDRAM address	5E	5F	60	61	62	63	64	65	66	67

“1-1” means first character of line 1 on screen, other two lines on same

● Instruction Description

A. Clear Display

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

Clear all the display data by writing “20H”(space code) to all DDRAM address, and set DDRAM address to “00H” into AC(address counter).

Return cursor to the original status, namely, bring the cursor to the left edge on the first line of the display.

Make the entry mode increment(I/D=“High”).

B. Return Home

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	-

Set DDRAM address to “00H” into the address counter.

Return cursor to its original site and return display to its original status,if shifted.

Contents of DDRAM does not change.

C. Entry Mode Set

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	SH

Set the moving direction of cursor and display.

I/D:Increment /decrement of DDRAM address(cursor or blink)

I/D=High,cursor/blink moves to right and DDRAM address is increased by 1.

I/D=low,cursor/blink moves to left and DDRAM address is decreased by 1.

*CGRAM operates the same way as DDRAM, when reading from or writing to CGRAM.

SH:Shift of entire display

When DDRAM read (CGRAM read/write) operation or SH=Low,shifting of entire display is not performed.if SH=High, and DDRAM write operation,shift of entire display is performed according to I/D value(I/D=High,shift left,I/D=Low, shift right).

D. Display ON/OFF Control

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	C	B

D:Display ON/OFF control bit

When D=High, entire display is turned on.

When D=Low, display is turned off,but display data remains in DDRAM.

C:Cursor ON/OFF control bit

When C=High, cursor is turned on.

When C=Low, cursor is disappeared in current display ,but I/D register preserves its data.

B:Cursor Blink ON/OFF control bit

When B=High, cursor blink is on, which performs alternately between all the “High” data and display characters at the cursor position.

When B=Low ,blink is off.

E. Cursor or Display Shift

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	-	-

Shifting of right/left cursor position or display without writing or reading of display data.

This instruction is used to correct or search display data.

During 2-line mode display,cursor moves to the 2nd line after the 40th digit of the 1st line.

Note that display shift is performed simultaneously in all the lines.

When displayed data is shifted repeatedly,each line is shifted individually.

When display shift is performed,the contents of the address counter are not changed.

S/C	R/L	Operation
0	0	Shift cursor to the left, AC is decreased by1
0	1	Shift cursor to the right, AC is increased by1
1	0	Shift all the display to the left,cursor moves according to the display
1	1	Shift all the display to the right,cursor moves according to the display

F. Function set

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	F	-	-

DL:Interface data length control bit

When DL=High, it means 8-bit bus mode with MPU.

When DL=Low, it means 4-bit bus mode with MPU.

When 4-bit bus mode, it needs to transfer 4-bit data twice.

N:Display line number control bit

When N=Low, 1-line display mode is set.

When N=High, 2-line display mode is set.

F:Display font type control bit

When F=Low, 5x8 dots format display mode is set.

When F=High, 5x11 dots format display mode.

G. Set CGRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU.

H. Set DDRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0

Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

When 1-line display mode(N=Low),DDRAM address is from “00H” to “4FH”.

In 2-line display mode(N=High),DDRAM address in the 1st line is from “00H” to “27H”,and DDRAM address in the 2nd line is from “40H” to “67H”.

I. Read Busy Flag & Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0

This instruction shows whether IC is in internal operation or not .

If BF is “High”,internal operation is in progress and should wait until BF is to be Low,which by then the next instruction can be performed. In this instruction you can also read the value of the address counter.

J. Write data to RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Write binary 8-bit data to DDRAM/CGRAM.

The selection of RAM from DDRAM, and CGRAM, is set by the previous address set instruction (DDRAM address set, CGRAM address set).

RAM set instruction can also determine the AC direction to RAM.

After write operation, the address is automatically increased /decreased by 1, according to the entry mode.

K. Read data from RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM.

The selection of RAM is set by the previous address set instruction. If the address set instruction of RAM is not performed before this instruction, the data that has been read first is invalid, as the direction of AC is not yet determined. If RAM data is read several times without RAM address instructions set before read operation, the correct RAM data can be obtained from the second. But the first data would be incorrect, as there is no time margin to transfer RAM data.

In case of DDRAM read operation, cursor shift instruction plays the same role as DDRAM address set instruction, it also transfers RAM data to output data register.

After read operation, address counter is automatically increased/decreased by 1 according to the entry mode.

After CGRAM read operation, display shift may not be executed correctly.

Note: In case of RAM write operation, AC is increased/decreased by 1 as in read operation.

At this time, AC indicates the next address position, but only the previous data can be read by the read instruction.

● Display Data RAM(DDRAM)

DDRAM stores display data of maximum 80x8 bits(80 characters).

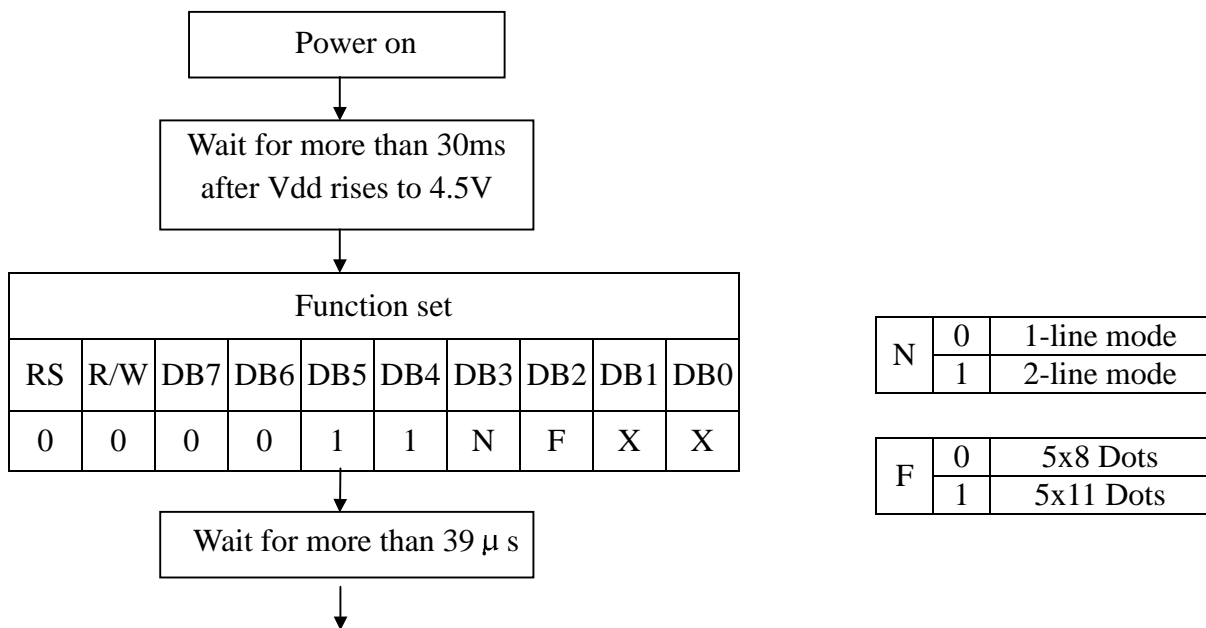

DDRAM address is set in the address counter(AC) as a hexadecimal number

MSB						LSB	
AC6	AC5	AC4	AC3	AC2	AC1	AC0	

● Relationship between Character Code and CGRAM

Character code									CGRAM Address						CGRAM Data								Pattern number
D7	D6	D5	D4	D3	D2	D1	D0	A5	A4	A3	A2	A1	A0	P7	P6	P5	P4	P3	P2	P1	P0		
0	0	0	0	x	0	0	0	0	0	0	0	0	0	x	x	x	0	1	1	1	0	pattern 1	
											0	0	1	x	x	x	1	0	0	0	1		
											0	1	0	x	x	x	1	0	0	0	1		
											0	1	1	x	x	x	1	1	1	1	1		
											1	0	0	x	x	x	1	0	0	0	1		
											1	0	1	x	x	x	1	0	0	0	1		
											1	1	0	x	x	x	1	0	0	0	1		
											1	1	1	x	x	x	0	0	0	0	0		
⋮									⋮						⋮								⋮
0	0	0	0	x	1	1	1	0	0	0	0	0	0	x	x	x	1	0	0	0	1	pattern8	
											0	0	1	x	x	x	1	0	0	0	1		
											0	1	0	x	x	x	1	0	0	0	1		
											0	1	1	x	x	x	1	1	1	1	1		
											1	0	0	x	x	x	1	0	0	0	1		
											1	0	1	x	x	x	1	0	0	0	1		
											1	1	0	x	x	x	1	0	0	0	1		
											1	1	1	x	x	x	0	0	0	0	0		

● Initializing Flowchart(Condition:fosc=270KHZ)

Display ON/OFF Control									
RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	C	B

Wait for more than 39 μ s

Display Clear									
RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

Wait for more than 1.53mS

Entry Mode Set									
RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	SH

Initialization End

D	0	Display off
	1	Display on

C	0	Cursor off
	1	Cursor on

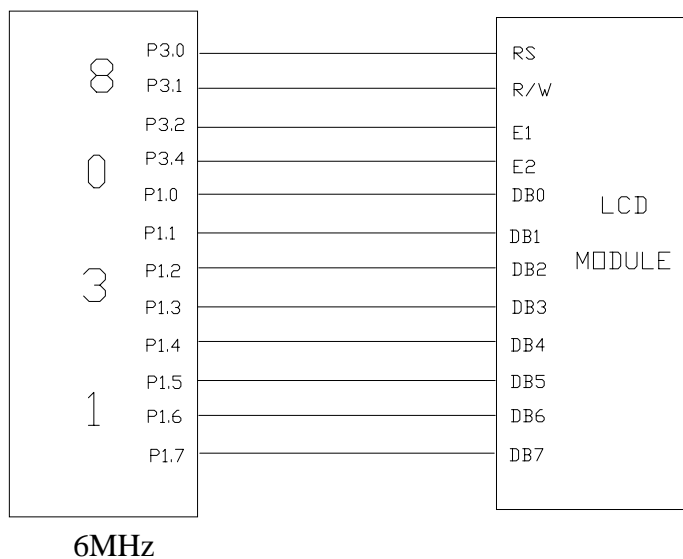

B	0	Blink off
	1	Blink on

I/D	0	Decrement mode
	1	Increment mode

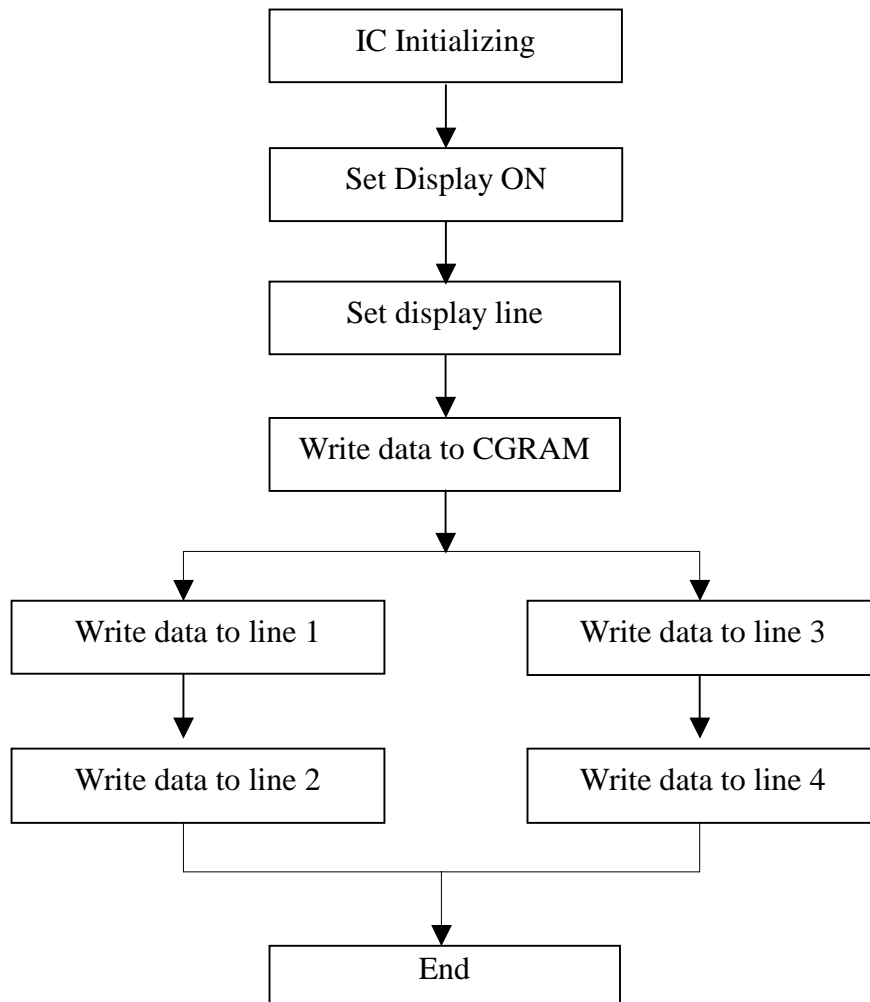

SH	0	Entire shift off
	1	Entire shift on
